The content of fluoride and ortho-phosphate (P) was determined in plaque fluid from carious and caries-free primary molars using a sensitive isotopic dilution technique. No difference in fluoride content could be demonstrated in plaque fluid between carious and caries-free primary molars, while the content of P was higher in the fluid from carious teeth than in that from caries-free teeth. The present invention relates generally to the area of robotic control and, more particularly, to a control system and method for controlling an autonomous mobile robotic system. Mobile robotic systems have been developed that are capable of performing tasks on their own. Typically, such mobile robotic systems are autonomous, i.e., able to move and perform actions on their own without human guidance. Such mobile robotic systems are designed to be able to perform different operations on a specific task. Examples of such operations include fetching objects, moving objects to a new location, and/or putting objects in a certain location. The performance of such tasks requires the autonomous mobile robotic systems to move and execute programmed actions to perform the tasks. If the mobile robotic system is unaware of the environment, and therefore cannot execute a task properly, the autonomous mobile robotic system may result in a failure or in a malfunction of the robotic system. For instance, if the mobile robotic system fails to find an object, the mobile robotic system may pick up an object that the mobile robotic system should not pick up. In other words, the mobile robotic system may "mistake" the wrong object for the right object. In order to execute the tasks and, more importantly, to avoid any undesirable situations, mobile robotic systems are required to be able to control themselves. Such control systems should be able 82157476af
